

THE CONVENIENCE OF AUDIO CONFERENCING

Audio conferencing is an easy-to-use service to enhance your business productivity. It's a low-cost, complete solution capable of hosting hundreds of attendees with no reservations required and no time limits imposed. Simply dial the number of your virtual conference and enter your identification code.

Simple Controls

Easy-to-follow audio prompts and a variety of features let you take complete control of your conference. Use your Moderator Web Interface for even greater functionality and control of features including:

Quick set up

You can set up a conference from anywhere. For single-click access to conference control, use the CommPortal Conference widget on a website. Or, set up and manage the call from your desktop or smartphone.

Dial in or dial out

Schedule a meeting where participants dial in at a specific time or add participants by simply dialing out during the conference.

Roll call

You may take a roll call of all conference participants and then lock your conference room when everyone is present. This enhances security and prevents interruptions.

Real-time participant list updates

See who is on the call at any time.

Recording a conference*

Simply start recording through your phone prompt or web interface. At the end of the conference call, your recording will be available in .WAV format for download through your moderator web interface. Easily archive or distribute the audio file via email.

Muting

Mute all participants or selectively as the topic requires. You can make the call easier for everyone by muting participants on connections that have a lot of line noise or background noise too.
